# Dell latitude 7480 repair manual

Artwork: Rick Rizner Doesn't have the slightest assumption about Dell's business notebook, the Latitude D510 has no flashy features of his siblings - D610's smart card reader and the D810 widescreen, for example. What it has is a handy case of charcoal color, a good keyboard, a handy multifunctional bay and a long-lasting battery, all for a good price. The \$1,509 D510 packs a 1.6-GHz Pentium M 730 processor, 15-inch XGA display, DVD-ROM/CD-RW drive (\$59 upgrade from standard CD-ROM drive) and 40GB hard drive. You can increase the configuration to include a DVD burner for an additional \$90, an 80GB hard drive for \$99 and a 1.86-GHz processor for \$190; or you can shave a little off the price and weight by ordering a 14.1-inch display and hollow travel module instead of an optical drive. Bluetooth and software cost extra (\$49 for Bluetooth and \$125 for Microsoft Office Basic Edition). Connections offer a good balance of old and new, including parallel and serial ports for legacy peripherals and four USB ports, two on the right for quick access and two from the back, plus a FireWire port for digital video downloads. I liked the silence of the keyboard and its pleasantly mushy feel. The layout is fine, except for the location &lt;Delete&gt; key, which is buried in the second row from the top - not the most convenient place for a frequently used key. (More often it is placed in the upper right corner.) The touchpad mouse buttons have a burnt box shape that was easy for me to use. D510 doesn't have dedicated shortcut keys for apps, volume control, or anything else. On the plus side, the power status lights are located in a place that is quickly located on the right screen. The front stereo speakers are loud enough for presentations to a small group. The battery life of the D510 and the modular design really shine. This took 4 hours, 41 minutes on a single charge in our tests - more than an hour longer than the average portable. You can check how much power is left without turning on the notebook by pressing the handy external battery meter, and you can work even longer unadded to the electrical outlet using two batteries at once: The \$119 media cell battery fits into the modular bay instead of the optical drive. All interchangeable bay devices, including an 80GB (\$150) secondary hard drive, have built-in spring editions, a small luxury that saves me from having to tinker around the bottom of my laptop for release every time I want to switch devices. The D510 doesn't work with the highest connecting station Dell sells for the Latitude line (D/Dock Expansion Station, which includes an internal media bay), but the 240-pin lower connector accepts the \$179 D/Port Advanced Port Replicator, which adds a DVI digital monitor port and an S/PDIF port. The D510 performed well in our speed tests, earning a WorldBench score of 76 - slightly slower than other multifunctional notebooks we've seen, but not significantly. D510 is coming good documentation, albeit mainly in the form of an insubstantial, unrelated electronic user manual inconveniently buried in the Windows Help and Support Center. However, the manual is extensive enough and well organized for fairly easy finding information, so the lack of an index is not a big problem. Excelling in battery life and modular expansion, the Dell Latitude D510 is a fine mainstream business laptop. Carla Thornton Note: When you buy something after clicking links in our articles, we can earn a small commission. Read our affiliate link policy for more details. You read car magazines for the wheel reviews you want to buy and the odd machine you could never afford in a million years, but you can admire from afar. It's a Dell Latitude Z600 ultraslim laptop. Wait, sexy Dell Latitude? It's hardly practical - or economical - but if you're in forward-thinking tech, this portable one that starts at about \$2000-plus is worth a good-looking thuring. (Our review unit, as configured, sells for as little as \$4323 with its wireless charger and base station). First observation: Z600 is wide and thin. We're talking a laptop with a 16-inch display and only 0.57 inches thick (and weighs about 4.5 pounds with a standard 4-cell battery). It defies logic by creating such a large but thinner machine than many ultraportable ones. You'll have to take it everywhere and show it, but since it has a 16-inch screen, it's harder to find a bag to fit into. (If it's worth it, Sony's recently unveiled VAIO X Series ultraportables are a whole 0.02 inch thinner.) But I'm a little ahead of myself. Grab the Z600 and you'll feel a supple, almost rubbery, black cherry reminiscent of what Lenovo does on some ThinkPads. Open it and meet you with a panel of 1600 by 900 pixels. Along the right, Dell's TouchEdge LCD sensor technology replaces the need to clutter the machine with many shortcuts (you'll find volume controls parked above the keyboard, plus a shortcut button for a moment - more on the latter per minute). Just tap the indent at the bottom of the panel and it drags a layer of shortcuts to apply. Tap the box and start any program you configure. It works really well. And the colors of the screen are sharp enough with the pictures. The WLED flap panel does a great job of reproducing a gamut of rich, dark ocean-like tones, as well as those of bright, vibrant jungle scenes (think sample images in your computer's Pictures folder) and constantly looking sharp whether indoors or outdoors. The shine is minimal. And the 720p video installed on one 128GB solid-state drive (our machine came configured with two SSDs) runs smoothly - a small triumph for the integrated Intel 4500MHD GPU, no doubt. Under the hood of this test platform: Intel Core 2 Duo SU9600 1.6GHz CPU and 4GB of RAM. In addition to the two aforementioned hard disks, these are the hoses you'll find in something like Acer Timeline. Nwo as well as spitting performance numbers, keep one caveat in mind: Our machine came loaded with Windows Vista Ultimate. The safe bet is that the computer you would consider buying - assuming you have tons of money - will come loaded with some taste of Windows 7. But the Z600 got away with a 78 -- fairly average but impressive given the size of the machine. Do you want to get a little more life out of the machine - or not go into Windows proper? Try Latitude ON, a quick firing OS that boots in 4 seconds. Not bad considering you run out of separate ARM CPU, 512MB of RAM and Linux. Sign in and use 3G WWAN (wide area wireless networking) for easy access to email, contacts, and calendar information synchronized with your Exchange server or through POP. You can use it to view MS Office documents and PDF files. It's obviously aimed at a mobile businessman on the move. And you can also hit the web. Just don't expect miracles. It will not synchronize with Outlook in Windows. And if you're trying a hot replacement between Windows and Latitude ON, you'll find some time between powering one OS and starting another. (Spokespeople say the ARM processor won't profoundly reduce battery life; we'll keep you announced about what we find). As neat as all this may be, we've seen variants of the Linux Quick Launch option in HP and Asus laptops. Dell also pops up in a few proprietary apps that you could actually use. The optional 2-megapixel camera works with the rather impressive Dell Capture software for scanning business cards; As long as you hold the normal card, the app will read all the information and plug it into the contact manager. The software also scans the documents directly into PDF format. You also have options for biometric locks, either through the FaceAware app that uses a webcam or a fingerprint scanner located next to the keyboard. Speaking of keyboard, it feels, like a rubber finish around the machine, soft to the touch, and the cut-out keys look suitably sprung and responsive. Although it looks all beautiful and well framed floating in the middle of the computer, I can't help wondering if this is one area where the shape trumped function for the worse. I'd like to see a little more room for the keys to get your hair down. And the keys in the top row - from the Esc button and the function to delete at the end - look disproportionately (and unnecessarily) small. You know what's not small? Multitouch mousing area and good key sizes. Also a little unusual and one of the bigger selling points of this laptop is the wireless base for charging laptops. This \$250 plugin runs the Z600 through a board similar to the way the induction coil works in the Palm Pre Touchstone charger. The laptop is powered as fast as if you plugged it directly into an electric brick. And despite some bloggers crying about how big the charging station is, I honestly can after testing, that it's no bigger than the other elevated docking stations I've seen. It's just your high-tech business. What I really want is a smaller, smarter charging pad that can feed the correct voltages to different devices. Hey, I'm allowed to dream. As for battery life - whether charging it via cool new wireless or old tyme cable - it only takes 3 hours in PC World lab tests. This is scarce for almost every standard that is worse than most multifunctional computers, ultraportables and even current generation netbooks. Another (but slightly less sexy) wireless option is a docking station. No dongles required, it does the frame with its Z600. It has four USB 2.0 ports, along with DVI-out video, headphones and microphone exits. Another exorbitant addition that came with the Z600: a smoothly matching 4X external BD-ROM drive that further increases the price. But if you're buying this machine, you're not what I'd find frugal. Despite being so thin, the Z600 makes room for one USB 2.0 port, one hybrid USB/eSATA port, DisplayLink video port and headphone/microphone port. Smart hiding behind the screen - battery parentheation - are power and ethernet ports. Unfortunately, when trying to do so much in so little space, some sacrifices have to be made. The lack of flash card readers may not be a deal breaker for any CEO given this model, but it's for me. And the sound is loud, but tinny afterthought. Get headphones, stat. In addition, you will get 802.11n Wi-Fi, Bluetooth, optional 3G WWAN (mentioned above) and wiimax confectionary capability. The Z600 is a fancy-looking machine. So much so that a test flight near the Macworld business area brought a few nods. But is it perfect? no. While incredibly thin and surprisingly light, it's still a 16-inch laptop that may find it difficult for you to fit in a travel bag. The Z600 can be perfectly adapted as an interoffice status symbol, but for practical mobility I would ask for a laptop with a smaller screen. Keep features, lower the price (and screen size), and it could be killer ultraportable. Bottom line, the Z600 is very not for everyone. In fact, I think they made this notebook just to sell it to Michael Dell and maybe a couple of his friends. But it boasts design savvy and a few technological innovations that I'd like to see descend on mainstream portable devices (with slightly smarter implementations). Until then, I can dream - Darren Gladstone Note: When you buy something after clicking links in our articles, we can earn a small commission. Read our affiliate link policy for more details.
